Proctor Landing Park Design Features

CULVERT BRIDGE

A pedestrian and bicycle bridge spans near 150 ft abutting halfway on the the culvert, carrying the trail across the creek both above and below. The structure is supported by vertical posts and steel tension rods along the bridge. Steel beams provide support against the reinforced culvert and Boardwalk posts anchored to concrete footings are set into the riparian slopes. The design maintains hydrological capacity of the creek while providing a safe, inviting crossing for trail users meaning to reach campsites and the Ohio River Connection.

CENTRAL PLANTING DESIGN

The central planting scheme establishes a layered native habitat that supports pollinators, birds, and seasonal ecological activity within the core of the site. Trees, shrubs, grasses, and flowering perennials work together to provide structure, shade, and year-round habitat value while reinforcing identity of the landscape. As a visible and immersive planting zone, it strengthens biodiversity, improves environmental performance, and brings ecological function into everyday public experience.

BOARDWALKS

A series of boardwalk carries the trail over the wetland and creek, providing an elevated crossing while minimizing disturbance to the habitat below and still allowing for exploration of natural spaces. The structure is supported by vertical posts anchored to concrete footings, lifting the walkway above sensitive dynamic soil conditions and seasonal water movement. Gentle arches in more exploratory zones increases clearance, improves resilience during wet periods, and creates a more dynamic experience of moving through the landscape.

Programs & Feature Key

- Splash Pad**
Interactive water play made custom with blocks, seating, and nearby dog play space
- Sports Fields & Courts**
Soft baseball, open field, and flexible multi-sport ball areas and paved courts
- Dog Park**
Engagement based / fenced, shaped for weather with shade for dogs and visitors to engage
- Active Play & Exercise**
Active play and exercise areas tied to the primary path loop and secondary routes with
- Camp Grounds**
Build and create camping program areas placed along the edge of the site activity fields
- Ecological Core Plantings**
Wild, native, shade, and interactive gathering points distributed using key paths and routes
- Bridges & Circulation**
Loop movement, access points, boundaries and bridge structure integrate the park for pedestrian and exploration
- Ponds Wetlands & Paddy Creek**
Water body, creek corridor, wetland edges, and canopy areas frame the ecological core and function

System Reading

PROGRAMMING	Splash Pad / Sports Fields / Open Field / Multi-sport / Dog Park / Camp Grounds / Exercise Loop
CIRCULATION	Loop paths / Bridge crossings / Access entrance
ECOLOGICAL CORE	Plantings / Wetlands / Canopy areas / Shade structure
HYDROLOGY	Paddy Creek / Pond / Drainage corridor

Planting Zones & Schemes

Layered native planting strategies that expand canopy, strengthen habitat, and support resilient public landscapes.

The planting strategy expands canopy and canopy connectivity throughout 750,000 square feet of site, adding nearly 30,000 square feet of canopy. It includes an ecological performance plan that includes a list of about 100 species of plants and trees, including native and non-native species, and a list of about 100 species of plants and trees, including native and non-native species.

This planting palette is organized through a three-part habitat plan. Green marks Heavy Canopy / Woodland zones that expand shade, structure, and habitat. Gold marks Managed Planting / Upland zones with more open, actively maintained plantings that support pollinators and seasonal interest. Blue marks Wetland / Riparian zones that stabilize edges, filter runoff, and respond to site hydrology. Together, these color-coded zones create a clear framework linking ecological function with public experience.

PLANTING

- Native plant species
- Pollinator friendly
- Seasonal interest

The planting strategy and design plan is intended to provide strong seasonal color, pollinator support, and create a planting scheme that is both functional and aesthetically pleasing. The plan includes a list of about 100 species of plants and trees, including native and non-native species.

CULVERT BRIDGE

ARCHITECTURAL PERSPECTIVE ELEVATION

A pedestrian and bicycle bridge spans the culvert, connecting the trail across the creek. The structure is supported by a system of vertical posts and stainless steel tension rods anchored to concrete footings on the riprap slopes. The design preserves hydraulic capacity while providing a safe, inviting crossing for trail users.

Site Plan: Mipo-dong Wastewater Rx Expansion

This site in Mipo-dong expands Ulsan's wastewater treatment with integrated ecological and renewable systems. Rainwater filters through rain gardens into detention ponds, where it's purified before powering PEM electrolysis to generate hydrogen fuel—driven by offshore wind energy. On-site hydrogen storage supports clean energy goals. Public hiking trails weave through the site, offering views of the city, the treatment infrastructure, and surrounding landscape. It's a functional, forward-thinking space—merging sustainability, energy innovation, and public engagement in one.

Circular Economies: Closing the Loop

It isn't just recycling—it's design that thinks ahead. Circular economies are about systems that feed themselves: outputs becoming inputs, waste turning into resource. It's cleaner, smarter, and honestly just makes more sense. When industries connect their dots, we get something tighter, more efficient, and way less destructive.
