LANDSCAPE
ARCHITECTURE

MATTHEW REINDL MLA · UC DAAP · 2026

My work explores the connections between people, place, and ecology through informed, resilient landscapes shaped by community needs and a sense of place.

Contents

My focus through the program was how the built environment and nature can work together for improved ecological and social function.

9 **Promenade & Pond**
Wetlands Hydrology & Public Access

Proctor Landing Park Design Features

CULVERT BRIDGE

A pedestrian and bicycle bridge spans nealr 150 ft abutting halfway on the the culvert, carrying the trail across the creek both above and below. The structure is supported by vertical posts and steel tension rods along the bridge. Steel beams provide support against the reinforced culvert and Boardwalk posts anchored to concrete footings are set into the riprarian slopes. The design maintains hydrological capacity of the creek while providing a safe, inviting crossing for trail users meaning to reach campsites and the Ohio River Connection.

CENTRAL PLANTING DESIGN

The central planting scheme establishes a layered native habitat that supports pollinators, birds, and seasonal ecological activity within the c of the site. Trees, shrubs, grasses, and flowering perennials work togeth provide structure, shade, and year-round habitat value while reinforcing identity of the landscape. As a visible and immersive planting zone, it strengthens biodiversity, improves environmental performance, and bri ecological function into everyday public experience.

BUS AND BIKE STATION ENTRY

The bus and bike station marks a primary arrival point to the park, creating a clear multimodal gateway for transit riders, cyclists, and pedestrians. By linking trail access, bicycle parking, and public transportation in one visible location, the entry improves accessibility, reduces reliance on cars, and supports healthier everyday movement. As a threshold into the site, it connects community mobility with recreation and ecological access.

EXERCISE

The exercise loop movement throu circulation route walking, jogging, use. Tree canopy riparian access p microclimates an helping users rec during warmer m combining exerci contact with the loop strengthens and the comfort

Matthew Reindl | LAND 7007 | University of Cincinnati | DAAP | MLA 2026

BOARDWALKS

A series of boardwalk carries the trail over the wetland and creek, providing an elevated crossing while minimizing disturbance to the habitat below and still allowing for exploration of natural spaces. The structure is supported by vertical posts anchored to concrete footings, lifting the walkway above sensitive dynamic doil conditions and seasonal water movement. Gentle arches in more explorable zones increases clearance, improves resilience during wet periods, and creates a more dynamic experience of moving through the landscape.

SPLASH PAD

The splash pad functions as a heat mitigation amenity, providing direct evaporative cooling and a comfortable summer destination for children and families. Water play, shaded seating, and surrounding planting work together to reduce perceived heat, improve thermal comfort, and support outdoor activity during the hottest months. As both recreation and climate-responsive infrastructure, the space strengthens public health while making the park more usable in extreme summer conditions.
