

Design Systems Overview

The master plan is organized through two interdependent design systems that translate the project's central ideas into built landscape structure. The first is an ecological core centered on Paddy Creek and the surrounding low ground, where wetlands, riparian planting, boardwalks, and restorative landscapes manage water, support habitat, and give the park its strongest environmental identity. The second is an active social system structured by the primary loop, distributed anchors, and visible public destinations, where play, exercise, sport, and gathering support daily use and community life.

Design Elements	Public Health	Social Connection	Ecological Function	River Access	Climate/ Heat Relief
Bridge / Park Connector	Encourages walking between towns	Landmark gathering space	Minimal footprint crossing	Direct link to river edge	Shade structures possible
Splash Pad	Cooling and active play	Family gathering space	Permeable base stormwater reuse	Draws people toward river side	Major heat mitigation
Sports Fields	Organized physical activity	Community leagues and events	Turf drainage management	Visual connection to river corridor	Open airflow reduces heat buildup
Open Field Exercise Loop	Walking, jogging and mobility	Shared casual recreation	Low impact turf and tree edges	Connects circulation to river paths	Shade nodes along loop
Riparian Wetlands and Boardwalk	Restorative walking	Quiet casual recreation	Habitat restoration and flood storage	Direct immersion in river ecology	Cooler microclimate
Meadow Habitat Areas	Passive health benefits	Educational landscape	Direct immersion in river ecology	Direct immersion in river paths	Reduced mowing heat exposure
River Overlook and Access Node	Mental health & reflection	Social destination	Bank stabilization planting	Primary river contact	Breezes & shade structures

These systems are not separate. They rely on one another. The ecological core gives the park resilience, texture, and restorative value, while the active social system gives it movement, visibility, and repeated public use. Together, they translate water, movement, and draw into a legible public health landscape. The park works as a system because ecological performance and public life are designed.

Ecological Core Restoration & Gravitational Draw

The ecological core forms the centerpiece of Proctor Landing Park. Organized around Paddy Creek and the surrounding low ground, it transforms flood-prone land into the park's most immersive and restorative landscape experience. Wetlands, riparian planting, and flood-adaptive open space give this zone ecological function, while boardwalks, overlooks, and planted edges make it a place people are drawn toward rather than pushed away from.
