

Diagram Evolution

The concept moved from a relational idea of space into a measured spatial system. These diagrams show how the project developed from framework to park structure and finally a true scale drawing.

Bridge

Public health links social and ecological infrastructure through one shared framework.

Paddy Creek becomes the central organizer, defining the park's restorative spine and flood-adaptive core and boardwalks and bridges became a central thematic design choice. The ecology of the site as it existed was in need of a rework and people need to see the benefits in real time, experientially with their hands in the dirt so to speak.

Movement Loop

A continuous primary loop turns circulation into the project's main health infrastructure and connects all major destinations. Distributed anchors and a low-to-high engagement gradient organize restoration, gathering, and activity across the site. Variation in the loops possibilities could drive repeat use and exploration as well as informal play. The programming anchors would be placed to drive the use of the circulation away from entry nodes. Choices of engagement and effort were valuable to utilizing the existing topography.

Bottom line: the concept became stronger as it moved from metaphor to structure bridge, creek, loop, and anchors. as it became a fully designed space.

Key zones

Primary program areas and spatial anchors across the site

Ecological core

Exercise loop

Splash pad / social zone

Play / gathering zone

Boardwalk / creek crossings

River edge

Open lawns

Sports fields

Master Plan

This design plan reworks the site from a remote and under-linked open field into a legible park system of connected destinations. A central ecological core anchors the landscape, while accessible circulation links active recreation, quieter restorative spaces, and flood-tolerant open areas. The result is a park that supports daily use, seasonal variation, and long-term ecological function without separating people from the systems that shape the site.

The master plan brings together the project's central goals through one coordinated landscape framework. It organizes water as ecological infrastructure, movement as health infrastructure, and draw as social infrastructure, creating a park that supports flood adaptation, everyday recreation, and long-term public value

Legend

- 1 Site Access & Entry
- 2 Passive Social Spaces
- 3 Passive Ecological Zones
- 4 Programmed Social Spaces
- 5 Active Engagement Zone
- 6 Ecological Core
- 7 Camping Spaces & Deeper Retreats
- 8 Ohio River & Trail Connections

Section 4 | Design Systems & Details

This section breaks the master plan into its major systems and design details. It moves from ecological and active-social systems to focused detail studies, material character, and the spatial language that gives the park its identity.
