

Paddy Creek Bridge & Culvert Crossing

The Paddy Creek Pedestrian bridge and culvert crossing is a core moment where the park's ecological, social, and public health goals converge. What begins as a constrained access condition becomes a memorable threshold into the landscape. Paired paths move through the culvert on both sides of the creek, while a short boardwalk crossing links them above the water. This sequence turns necessary infrastructure into an immersive experience of movement, sound, shade, and proximity to the creek.

As an ecological feature, the crossing reveals the presence of water rather than hiding it. As a social feature, it creates a shared moment of passage, pause, and orientation within the park. As a health feature, it supports safe, accessible circulation through a flood-prone condition while encouraging walking, exploration, and contact with restorative landscape systems. Timber, metal, and cobblestone give the crossing a grounded material character that feels durable, legible, and tied to the floodplain. The result is not only a crossing, but a centerpiece where infrastructure becomes experience, and where ecology, movement, and community meet.

Section 5 | Materials Implementation & Performance

This section documents the project as a viable framework for implementation. It includes area takeoffs, cost and phasing logic, performance evaluation, and the concluding statement of public value that ties the proposal back to its public-health purpose.
