

Contents

My focus through the program was how the built environment and nature can work together for improved ecological and social function.

Proctor Landing Park Design Features

CULVERT BRIDGE

A pedestrian and bicycle bridge spans near 150 ft abutting halfway on the the culvert, carrying the trail across the creek both above and below. The structure is supported by vertical posts and steel tension rods along the bridge. Steel beams provide support against the reinforced culvert and Boardwalk posts anchored to concrete footings are set into the riparian slopes. The design maintains hydrological capacity of the creek while providing a safe, inviting crossing for trail users meaning to reach campsites and the Ohio River Connection.

CENTRAL PLANTING DESIGN

The central planting scheme establishes a layered native habitat that supports pollinators, birds, and seasonal ecological activity within the center of the site. Trees, shrubs, grasses, and flowering perennials work together to provide structure, shade, and year-round habitat value while reinforcing the identity of the landscape. As a visible and immersive planting zone, it strengthens biodiversity, improves environmental performance, and brings ecological function into everyday public experience.

BOARDWALKS

A series of boardwalk carries the trail over the wetland and creek, providing an elevated crossing while minimizing disturbance to the habitat below and still allowing for exploration of natural spaces. The structure is supported by vertical posts anchored to concrete footings, lifting the walkway above sensitive dynamic soil conditions and seasonal water movement. Gentle arches in more exploratory zones increase clearance, improve resilience during wet periods, and create a more dynamic experience of moving through the landscape.

PROCTOR LANDING PARK

SITE PROGRAM + FEATURE SYSTEMS

MATTHEW REINDL / LAND TROU / UNIVERSITY OF CHICAGO / CHICAGO, ILL. 2024

Programs & Feature Key

- 1 Splash Pad**
Interactive water play with slides, spraying, and multiple play zones.
- 2 Sports Fields & Courts**
Soccer fields, open field, and flexible multi-use space with outdoor courts.
- 3 Dog Park**
Dedicated fenced-in space, designed for visitors with dogs and access to nearby trails.
- 4 Active Play & Exercise**
Active play and exercise area with a variety of play equipment and trails.
- 5 Camp Grounds**
Camp and picnic area with picnic tables and access to nearby trails.
- 6 Ecological Core Plantings**
Native plantings, shrubs, and flowering plants along the edge of the site.
- 7 Bridges & Circulation**
Wooden bridges, paths, and trails connecting the site to the surrounding area.
- 8 Ponds Wetlands & Paddy Creek**
Ponds, wetlands, and paddy fields along the edge of the site.

Planting Zones & Schemes

Layered native planting strategies that expand canopy, strengthen habitat, and support resilient public landscapes.

The planting strategy expands canopy and canopy connectivity for canopy 20,000 square feet to about 60,000 square feet, adding nearly 100,000 square feet of forest habitat and ecological performance. The strategy is based on about 10 acres of native plantings, including native trees, shrubs, and groundcover plants, and native tree species. The strategy is based on native plantings, including native trees, shrubs, and groundcover plants, and native tree species. The strategy is based on native plantings, including native trees, shrubs, and groundcover plants, and native tree species.

This planting palette is organized through a three-part habitat plan. Green marks Heavy Canopy / Woodland zones that expand shade, structure, and habitat. Gold marks Managed Planting / Upland zones with more open, actively maintained plantings that support pollinators and seasonal interest. Blue marks Wetland / Riparian zones that stabilize edges, filter runoff, and respond to site hydrology. Together, these color-coded zones create a clear framework linking ecological function with public experience.

The strategy identifies and plans habitat to increase in canopy, strengthen habitat, and support resilient public landscapes. The strategy is based on native plantings, including native trees, shrubs, and groundcover plants, and native tree species. The strategy is based on native plantings, including native trees, shrubs, and groundcover plants, and native tree species. The strategy is based on native plantings, including native trees, shrubs, and groundcover plants, and native tree species.

CULVERT BRIDGE

ARCHITECTURAL PERSPECTIVE ELEVATION

A pedestrian and bicycle bridge spans the culvert, connecting the trail across the creek. The structure is supported by a system of vertical posts and stainless steel tension rods anchored to concrete footings on the rising slopes. The design preserves hydraulic capacity while providing a safe, inviting crossing for trail users.

I'm proud to have seen my capstone recognized through an SEG D Director's Choice selection and by the Design Museum of Chicago. These honors affirm the project's focus on place, community, and environmental purpose while marking an important milestone in my growth as a designer.

Circular Economies:
Closing the Loop

It isn't just recycling—it's design that thinks ahead. Circular economies are about systems that feed themselves: outputs becoming inputs, waste turning into resource. It's cleaner, smarter, and honestly just makes more sense. When industries connect their dots, we get something tighter, more efficient, and way less destructive.

8.2 Concept 1, bridge crossing over the restored wetland

8.3 Concept 1, promenade along the wetland edge

Concept 2 keeps the existing dam and expands recreation around it: a plaza on the impoundment, a splash pad, and courts drawn up to the water.
