

Impact Metrics

This matrix translates the master plan into a set of measurable design interventions. Rather than treating the park as a single object, it breaks the proposal into specific program elements and shows how each contributes to public health, social life, and ecological performance. Read together, the matrix makes clear that the project is not driven by one goal alone, but by overlapping forms of value across the site.

The strongest interventions are those that perform across multiple categories at once. The exercise loop, trail network, shade structures, and central bridge are especially important because they do more than support one type of use. They connect movement, comfort, visibility, and ecological experience into shared public infrastructure.

 IMPACT MATRIX Design Intervention Impact Matrix Program elements translated into public health, social, and ecological value.				
INTERVENTION	PUBLIC HEALTH	SOCIAL	ECOLOGICAL	SPATIAL READING
 Elevated Exercise Loop	● ● ●	● ● ●	● ● ●	Flood-safe circulation
 Central Bridge Node	● ● ●	● ● ●	● ● ●	Social + movement anchor
 Splash Pad (elevated)	● ● ●	● ● ●	● ● ●	Cooling + attraction
 Sports Fields	● ● ●	● ● ●	● ● ●	Structured recreation
 Dog Park	● ● ●	● ● ●	● ● ●	Daily-use social space
 Open Field Zones	● ● ●	● ● ●	● ● ●	Flexible activity
 Shade Structures	● ● ●	● ● ●	● ● ●	Comfort + dwell time
 Wetland Basin	● ● ●	● ● ●	● ● ●	Flood + habitat
 Riparian Restoration	● ● ●	● ● ●	● ● ●	Stabilization
 Planted Ecological Zones	● ● ●	● ● ●	● ● ●	Habitat + experience
 Trail Network	● ● ●	● ● ●	● ● ●	Site connectivity

PERFORMANCE FRAMEWORK Design Performance Framework Goal cards connect program element, indicator, spatial metric, and intended measure of success.

PUBLIC HEALTH movement, comfort, access	SOCIAL encounter, visibility, dwell	ECOLOGICAL water, habitat, thermal performance
1 Exercise Loop - Daily use rate 5-min. walk rate % within 5-min walk 100% access	1 Central Bridge - Interaction density - Node connectivity % visible - High dwell time	1 Wetland Basin - Water storage - Floodplain integration % reduced runoff
2 Sports Fields - Participation rate - Park utilization - Proximity to entry + parking - High seasonal use	2 Open Fields - Group activity - Visibility + adjacency - Flexible use	2 Riparian Zones - Habitat presence - Linear continuity - Increased biodiversity
3 Splash Pad - Heat mitigation + use - Distance to neighborhoods - Usage count - High summer use	3 Shade Structures - Dwell time - Sitting duration along paths - Increased stay duration	3 Planted Eco Zones - Vegetation diversity - Coverage across site - Multi-layer planting
4 Dog Park - Daily visits - Park utilization - Edge placement + access - Consistent daily use	4 Gathering Nodes - Informal interaction - Event small distribution - Consistent occupancy	4 Tree Canopy - Thermal regulation - Shade over paths + nodes - Lower temps
5 Trail Network - Movement frequency - Connectivity across site 5-min. walk - Continuous circulation		

Performance Framework

This framework identifies how success is intended to be measured across the park. Each program element is paired with a set of indicators and spatial metrics so that design intent can be evaluated beyond appearance alone. Public health metrics focus on movement, comfort, and access. Social metrics focus on encounter, visibility, and dwell. Ecological metrics focus on water, habitat, and thermal performance.

Together, these categories establish a practical performance structure for the project. They show how the site can be assessed as a public health landscape, where exercise, gathering, planting, flood adaptation, and shade are all tied to intended outcomes rather than treated as isolated amenities.

Conflict Mitigation

This framework explains how the plan responds to the tensions built into the site. Recreation and habitat, visibility and refuge, flooding and access, and high use and long-term preservation all create real conflicts that had to be resolved spatially. The strategies shown here translate those conflicts into design decisions rather than allowing them to remain abstract problems.

This is important because performance in the project is not only about maximizing benefits. It is also about reducing friction between competing needs. By locating activity carefully, elevating paths where needed, reinforcing high-use areas, and using planting strategically, the plan becomes more resilient, more usable, and more internally coherent.

 CONFLICT MITIGATION Site Plan Conflict Mitigation Strategies Conflicting conditions are diagrammed as tensions, then resolved through location-specific design responses.				
Active LOCATION: Wetland edge	VS	Passive LOCATION: Habitat disturbance	DESIGN RESPONSE	 Activity pushed outward to perimeter
Social LOCATION: Central zones	VS	Ecological LOCATION: Habitat pressure	DESIGN RESPONSE	 Strategic zoning + vegetative buffers
Flooding LOCATION: Lowlands	VS	Access RISK: Inaccessibility	DESIGN RESPONSE	 Elevated paths + resilient materials
Visibility LOCATION: Riparian zones	VS	Refuge NEED: Safety vs. habitat	DESIGN RESPONSE	 Layered planting (clear sightlines at eye level)
High Use LOCATION: Fields + nodes	VS	Preservation RISK: Soil/plant wear	DESIGN RESPONSE	 Durable surfaces + reinforced turf in high-traffic areas

Closing

Proctor Landing Park is proposed as more than a recreational site. It is envisioned as a public health landscape where ecological systems and social infrastructure work together to support daily life. In a county shaped by chronic health challenges, fragmented recreation access, and recurring flood conditions, the project argues that landscape can operate as preventative infrastructure. Movement, restoration, and community use are not treated as separate amenities, but as interdependent parts of a healthier public environment.

At the center of the proposal is the idea of the bridge: a place where ecology and social life are not in competition, but in support of one another. Wetlands, riparian systems, canopy, and flood-adaptive planting strengthen environmental performance while also creating restorative and memorable public space. At the same time, loops, play spaces, gathering nodes, and active destinations invite repeated movement, visibility, and social connection. Together, these systems frame public health not as an abstract outcome, but as something spatially supported through access, comfort, activity, and ecological experience.

The project ultimately suggests that resilient parks can do more than withstand environmental conditions. They can improve how a community lives with them. By bridging water, movement, and draw, Proctor Landing Park becomes a model for how landscape architecture can support public health through spaces that are socially engaging, ecologically legible, and built for long-term public value.

A detailed landscape architectural site plan overlaid on a topographic map. The plan features a central green area with various circular and organic shapes, possibly representing ponds or landscaped zones. To the left, there are two rectangular sports fields with goalposts, a building, and a parking lot. To the right, there are more buildings, a parking lot, and a winding path. The topographic map shows contour lines and a river or stream flowing through the site. The text "Thank You!" is centered over the plan in a large, blue, sans-serif font.

Thank
You!
